

# ENERFLEX STREAMLINES SAFETY PROTOCOL

---

Global operating company partners with PSS Industrial Group to implement a new hand protection program.

## **Background:**

Enerflex's integrated loss management system determines potential losses and analyzes causes and effects with a view to identifying corrective measures. Supporting this process is detailed data collection and statistical analysis on types of incidents, root causes, frequencies, severities and consequences to drive corrective actions that produce the greatest reduction in loss frequency. Incidents are rigorously investigated, with the results reported to management. The process includes a mechanism to take corrective action.

## **Challenge: Reduction in Hand Injuries**

Hand injury reduction is a key safety focus to Enerflex. Reporting an average of 5 hand injuries per week, they partnered with PSS Group to provide a successful solution to reduce loss time and worker's comp claims.

## **Solution and Results:**

PSSI & Enerflex has a long-standing partnership providing personal protective equipment. The HSE Manager and the PSSI Account Manager engaged in a glove standardization program to assist Enerflex in selecting an appropriate glove for their applications to eliminate hand injuries on the jobsite. This process took roughly 2 months to select the top style of gloves, wear and test in numerous nation-wide locations, process feedback, revise the selection and roll-out the program. Based on the glove offering now, Enerflex anticipates hand injury recordables to be reduced to zero.
